Dear Dilan:

INTRODUCTION

Roux Associates, Inc. (Roux), on behalf of Duke Realty Foundry LP, has prepared this Weekly Progress Report (Weekly Report) as set forth in the Final Community Air Monitoring Plan (Final CAMP) (Roux, 2023) prepared in support of vertical demolition activities at 7825 San Leandro Street in Oakland, California (Site). The Final CAMP was conditionally approved via email by the Alameda County Department of Environmental Health (ACDEH) on August 24, 2023¹. This Weekly Report provides a summary of the perimeter air monitoring program conducted during demolition work at the Site from September 18 through 22, 2023. It is anticipated that demolition work will be completed in the fourth quarter of 2023.

The Final CAMP describes the necessary monitoring activities and control measures to be implemented for dust mitigation during vertical demolition. The Final CAMP was prepared in accordance with the Community Air Monitoring Plan Guidance (CAMP Guidance) prepared by the California Environmental Protection Agency (CalEPA) and the California Department of Toxic Substances Control (DTSC) dated January 2020 (CalEPA/DTSC, 2020). The Final CAMP incorporated changes to the scope of work requested by the ACDEH in directive letters issued on July 13, 2023, and August 23, 2023. The monitoring activities and control measures presented in the Final CAMP comply with applicable regulations and are protective of off-Site populations and on-Site construction workers.

The ACDEH Local Oversight Program (LOP) for Hazardous Materials Releases is the lead regulatory agency for the Site. Environmental investigations and clean-up actions at the Site are being undertaken under the oversight of that agency Site Clean-up Program (SCP), with GeoTracker Global ID T10000019792 and ACDEH Case Number RO0003535.

Site Description

The Site is located at 7741, 7825, and 7929 San Leandro Street in Oakland, California. For simplicity and consistency with regulatory communication, 7825 San Leandro Street will be used to reference the

location. The Site consists of approximately 14.5 acres and was previously developed with a two-story office building, multiple warehouses, a foundry and manufacturing building, material storage, and a parking lot. The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located to the west, Oakland Truck Stop to the east, Elmhurst Creek along the southeast property corner, and San Leandro Bay is approximately one mile to the west. The nearest residential areas are approximately 1,500 feet north and east of the Site.

SITE BOUNDARY MONITORING

This Section describes the air monitoring program that was implemented at the Site from September 18 through 22, 2023 during demolition activities. Monitoring described in this section was conducted using field equipment that allowed for real-time monitoring of PM₁₀ and meteorological conditions. Monitoring at the Site boundary consisted of the following activities in six air monitoring stations (AMS-01 through AMS-06) as shown on Figure 1:

- Dust monitoring for PM₁₀; and
- Weather station monitoring for wind speed and direction.

Particulate Matter Monitoring

Airborne particulate matter (PM) is a complex mixture of particles that vary widely in size, shape, and chemical composition. Particles with a diameter of 10 microns or less (PM₁₀) are particles small enough to pass through the throat and nose and enter the lungs. PM₁₀ can be comprised of smoke, soot, salts, acids, metals, and dust, including wind-blown dust (CARB, 2023).

Measurements of real-time and 8-hour time-weighted averages (TWA) of airborne particulate concentrations were recorded daily during demolition work hours (generally from 7:00 am to 3:30 pm) using TSI DustTrak II Aerosol Monitors at sampling locations AMS-01 through AMS-06 (Appendix A).

During this weekly monitoring period, dust monitoring measurements ranged from 0 to 551 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). The Bay Area Air Quality Management District (BAAQMD) issued air quality advisories covering September 20 through September 22, 2023 due to wildfire smoke from Northern California and Oregon, which impacted air quality throughout the San Francisco Bay Area. Smoky, hazy skies were visible on site and resulted in higher than normal PM₁₀ dust levels site wide. Due to multiple air monitoring equipment malfunctions on September 22, 2023, demolition work was postponed until the equipment was repaired. Demolition activities did not resume until approximately 11:20 am when the air monitoring network was fully functional. Daily time-weighted averages of PM₁₀ measurements were calculated by Roux and are summarized in Table 1.

During the weekly monitoring period, there were no exceedances of the California Ambient Air Quality Standard (CAAQS) for PM₁₀ adopted by BAAQMD, which specifies a ceiling level of no more than 50 $\mu\text{g}/\text{m}^3$ difference between upwind and downwind sampling locations over the course of the day.

Weather Station Monitoring

A meteorological station was placed proximate to upwind location AMS-01 because its location was free from obstruction and representative of wind patterns present at the Site (see Figure 1). Measurements of wind speed, peak wind gust, direction, ambient temperature, relative humidity, and barometric pressure were recorded every minute during the demolition work period (generally from 7:00 am to 3:30 pm) using a Lufft WS500 Weather Station (Appendix A).

Roux prepared a wind rose diagram based on meteorological data collected during the weekly monitoring period (see Figure 2). As shown in the wind rose diagram, the prevailing wind direction was out of the west-northwest with wind speed ranging from 1.0 to 16.1 miles per hour (mph).

During the weekly monitoring period, there were no exceedances of the maximum wind speed (greater than 25 mph) nor 15-minute average wind speed (greater than 20 mph) action levels.

Air Sampling for Laboratory Analysis

Lead in air sampling was not performed during this weekly monitoring period because demolition of the cupola and associated baghouses has not begun. In accordance with the August 23, 2023, directive letter, Roux submitted a Human Health Risk Assessment (HHRA) to ACDEH on September 21, 2023 to evaluate potential risk from short-term exposure to lead adhered to particulate matter.

Dust Control Measures

The demolition contractor, Garrison Demolition Engineering (Garrison), continuously applied water to their work area and structures being demolished throughout the workday in accordance with dust control measures outlined in the Final CAMP.

Demolition Work Performed and Planned for Upcoming Week

From September 18 through 22, 2023, Garrison performed the following activities:

- Demolition of the former main building and non-cupola baghouses.
- Trucking/off-haul of stockpiled demolition debris.

Upcoming work activities will include the following:

- Continued demolition of the former main facility and buildings in the vicinity.
- Continued trucking/off-haul of stockpiled demolition debris.

CONCLUSIONS

During the period from September 18 through 22, 2023, Roux conducted a demolition air monitoring program to evaluate PM10 and meteorological conditions (wind speed, direction, temperature, humidity, etc.). As demonstrated during the baseline monitoring period (Roux, 2023b), the results indicate that PM10 levels vary significantly depending on several factors (i.e., weather conditions, the natural environment, and human activities) and ranged from 0 to 551 $\mu\text{g}/\text{m}^3$ during the weekly monitoring period. During this weekly period, PM10 dust readings were impacted by wildfire smoke from Northern California and Oregon which impacted air quality throughout the San Francisco Bay Area. Meteorological data confirmed the prevailing wind direction from the west/northwest.

During the weekly monitoring period, there were no exceedances of the CAAQS action level for PM10, 15-minute average wind speed action level, nor maximum wind speed action level.
